

Overview of Literature Assignment

Taylor White

Appalachian State University

RC2001-156

Professor Underwood

This literature review focuses on business management, mainly diving into how leadership, workplace environments, strategic decision making, and relationships within the workforce can

impact organizational performance. This research is driven by the question on how different management approaches are able to / can influence employee productivity, innovation, and overall business success in today's organizations.

The sources selected for this review were published between 2022 through 2025. This time frame ensures that the research can reflect current day challenges and the constant adaptation of today's workforce, such as digital transformation, globalization, and evolving environments.

The majority of the sources are peer reviewed, academic articles, in order to ensure credibility and reliability. There is also one public facing business article, and one professional insight article, in order to provide real world perspectives from people who work in the everyday workforce & specialize in organizational performance and relationships. The research was limited to sources that are directly related to leadership, organizational performance, and workplace success. These limitations were put in place in order to get a more focused examination of how different management practices can influence business outcomes in today's environment.

Through reviewing the sources listed, they all show clear patterns. The academic sources published through ScienceDirect, Taylor & Francis, and the National Library of Medicine, follow a organized and structured format that include an abstract, introduction, how they got

their results & analyzed their study, study results, and a conclusion. The public facing sources like The Harvard Business Review use a more flexible structure that has a more narrative flow. These structured approaches enable researchers to analyze information from a logical standpoint that is backed by different types of credibility.

The majority of academic articles in this field use formal and specialized terminology that are all related to leadership, strategy, and performance. These sources aim to avoid any personal / biased opinions and rely on actual experience and evidence. In these articles, words like "organizational performance", "dynamic capabilities", and "digital transformation", are often used. The writing in this field has a strong emphasis on professionalism. Public and professional sources on the other hand use more conversational / narrative language to engage to a different range of audiences, while still maintaining credibility. This shows how communication in business management can adapt quickly, depending on the audience it is intended for.

The use of these references shows the specific type of writing in this field. Academic articles heavily implement citations from their prior research, showing that knowledge in business management is built through a continuous scholarly and professional conversation. These sources rely on referencing in order to validate the claims that are made and connect findings to real world experience or answer theories. Public sources, however, rely more on an expert insight and real-world examples, rather than direct referencing and citations. These patterns show that writing in the business management field is mainly characterized by a balance between research driven analysis, and practical application focused communication.

A major theme that connects the sources together, is the role of leadership and its importance in shaping a workplace's organizational performance. Academic research has consistently emphasized the fact that leadership directly impacts employee productivity. A prime example is studies that are focusing more on strategic leadership and digital transformation due to the rapid change in today's technology, and highlighting how leaders who are more adaptable and forward thinking can be more effective in guiding the business through a sudden change (Orkamo et al., 2025). Public sources, similarly do the same as well by providing readers with real world

examples of how leadership is able to influence communication, teamwork, and overall success within a business's workplace. Throughout all of these sources, leadership is shown as a prime factor in the performance of a business.

Another key connection throughout all of these sources is the importance of a positive workplace and the impact it has on employee productivity. Both of the academic and public sources agree with the fact that a supporting and well managed environment leads to higher levels of satisfaction and efficiency within employees (Ajala et al., 2022). The academic articles present this through different types of data and research findings, while the public sources use scenarios and practical applications.

In addition to leadership and its effect on the workplace environment, strategic management and adaptability is also emphasized throughout the research, suggesting that businesses must continuously adjust their strategies in response to sudden changes like digital transformation. Academic articles refer to this as "dynamic capabilities", mainly talking about the importance of flexibility in order to maintain long term success. Public sources support the idea by showing how companies are able to apply these strategies into real situations.

When they're all looked at together, these sources suggest that the success of an organization is not influenced by a single factor, but by the interaction between leadership, workplace conditions, and adaptability (Olanrewaju et al., 2024; Ajala et al., 2022; Ruiz-Ortega et al., 2022). However, while the research provides a strong insight into these areas, there are still some

gaps. There is limited discussion on how these strategies differ from small & large organizations, and how future technological advancements may change future leadership practices. Overall, the sources show that business management is an evolving field that requires continuous adaptability.

WORKS CITED

(2026). Americanbusinessmag.com.

<https://www.americanbusinessmag.com/how-building-design-affects-long-term-cash-flow/>

- This article dives into the idea of how your building design can affect your profit/income as a business owner. It mainly examines key points, like Maintenance costs being predictable if you plan for them. It also highlights how flexibility has a dollar value, and that a building that locks you to one configuration is actually a liability just disguised as an asset.

(2025). *Leadership behavior in digital transformation and firm performance*. ScienceDirect.

<https://www.sciencedirect.com/science/article/pii/S266695442500050X>

- This article dives into how leadership behavior can affect company performance during digital transformation. It explains that leaders who are capable of adapting quick, being innovative, and data-driven help businesses succeed in modern environments. The study highlights that strong leadership improves decision-making, employee performance, and overall growth, especially when companies are transitioning into digital systems and technologies.

(2024). *Strategic leadership and organizational performance*. Taylor & Francis.

<https://www.tandfonline.com/doi/full/10.1080/23311975.2024.241661>

- This article explains how strategic leadership can influence organizational performance. It explains that leaders who focus more on long-term goals, innovation, and adaptability can further help businesses succeed. The study shows that leadership plays a major role in improving employee productivity, company culture, and decision-making, which all contribute to overall business growth and competitiveness.

(2024). *Building Cross-Cultural Relationships in a Global Workplace.*

Harvard Business Review. <https://hbr.org/2024/02/building-cross-cultural-relationships-in-a-global-workplace>

- This article explores how managers build and are able to implement strong relationships across different cultures in global workplaces. It talks about how understanding cultural differences improves communication, teamwork, and overall success when in the workplace. The article emphasizes emotional intelligence and adaptability as key skills for leaders managing diverse teams, showing that effective cross-cultural management leads to better performance and collaboration.
